The Gamma-ray Large Area Space Telescope

(GLAST)

S. Ritz (GSFC, Project Scientist), J. Grindlay (Harvard, Users Committee Chair), C. Meegan (MSFC, GBM PI), and P.F. Michelson (Stanford, LAT PI) on behalf of the GLAST Mission Team

Abstract

The Gamma-ray Large Area Space Telescope, GLAST, is a mission under construction to measure the cosmic gamma-ray flux in the energy range 20 MeV to >300 GeV, with supporting measurements for gamma-ray bursts from 10 keV to 25 MeV. With its launch in 2007, GLAST will open a new and important window on a wide variety of high energy phenomena, including black holes and active galactic nuclei; gamma-ray bursts; the origin of cosmic rays and supernova remnants; and searches for hypothetical new phenomena such as supersymmetric dark matter annihilations, Lorentz invariance violation, and exotic relics from the Big Bang. In addition to the science opportunities, this poster includes a description of the instruments, the opportunities for guest observers, and the mission status.

GLAST Science

EGRET on CGRO firmly established the field of high-energy gamma-ray astrophysics and demonstrated the importance and potential of this energy band. GLAST is the next great step beyond EGRET, providing a huge leap in capabilities.

GLAST will have a major impact on many topics, including:

- Systems with supermassive black holes (Active Galactic Nuclei)
- Gamma-ray bursts (GRBs)
- Pulsars
- Solar physics
- Origin of Cosmic Rays
- Probing the era of galaxy formation, optical-UV background light
- Solving the mystery of the high-energy unidentified sources
- Discovery! Particle Dark Matter? Other relics from the Big Bang?

Testing Lorentz invariance. New source classes.

Important overlap and complementarity with the next-generation ground-based gamma-ray observatories.

5σ Sources from Simulated >9000 sources One Year All-sky Survey Third EGRET Catalog E > 100 MeV▲ LMC Pulsars Solar Flare **♦** Active Galactic Nuclei Unidentified EGRET Sources Results of one-year Galactic Halo all-sky survey. (Total: 9900 sources)

GLAST draws together the High-energy Particle Physics and High-energy Astrophysics communities.

GLAST is the highest-ranked initiative in its category in the National Academy of Sciences 2000 Decadal Survey Report.

Level 1 Science Requirements Summary

Quantity	Requirement	Minimum	EGRET
Mission Lifetime	>5 years	>2 years	
LAT High-latitude Point Source Sensitivity (E>100 MeV)	<6x10 ⁻⁹ cm ⁻² s ⁻¹	<8x10 ⁻⁹ cm ⁻² s ⁻¹	~1x10 ⁻⁷ cm ⁻² s ⁻¹
LAT High-latitude Source Location Benchmark	<0.5 arcmin	<1 arcmin	5 arcmin
LAT Peak Effective Area	>8000 cm ²	>8000 cm ²	1500 cm²
LAT Energy Range	<20 MeV - > 300 GeV	<30 MeV - >100 GeV	20 MeV-30GeV
LAT Background Rejection	<10% high- latitude diffuse	<20% high-latitude diffuse	<1%
LAT Energy Resolution (on-axis, 100 MeV – 10 GeV)	<10%	<20%	10%
LAT Field of View	>2 sr	>1.5 sr	0.5 sr

565 km Circ

Kennedy Space Center

Launch Vehicle: Delta 7920H-10

Telemetry: TDRSS S-Band, Ku-Band

Large Area Telescope (LAT)

- Very large FOV (~20% of sky), factor 4 greater than EGRET Broadband (4 decades in energy, including unexplored
- region E > 10 GeV) Unprecedented PSF for gamma rays (factor > 3 better than EGRET for E>1 GeV)
- Large effective area (factor > 5 better than EGRET)
- Results in factor > 30 improvement in sensitivity
- Much smaller deadtime per event (25 microsec, factor >4,000 better than EGRET)
- No expendables => long mission without degradation

PI: Peter Michelson (Stanford & SLAC) ~200 Members (including ~70 Affiliated Scientists, plus 48 Postdocs and Graduate

Cooperation between NASA and DOE, with key international contributions from France, Italy, Japan and Sweden. **Managed at Stanford Linear Accelerator** Center (SLAC).

Tracker ACD [surrounds Calorimeter 4x4 array of TKR towers]

Two GLAST instruments: LAT: 20 MeV - > 300 GeV **GBM: 10 keV – 25 MeV**

LAT 1st Catalog:

Spacecraft

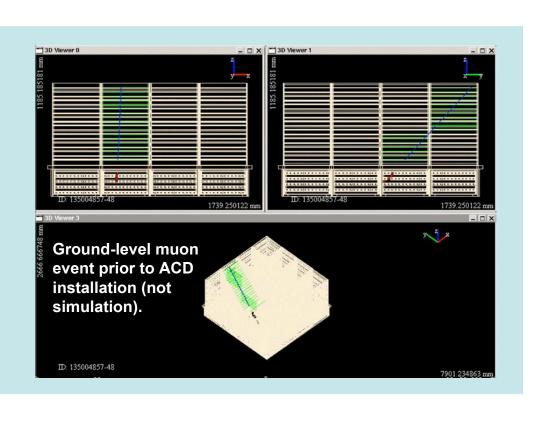

General Dynamics (Spectrum Astro)

- Precision Si-strip Tracker (TKR) 18 XY tracking planes. Single-sided silicon strip detectors (228 mm pitch) Measure the photon direction; gamma ID.
- Hodoscopic Csl Calorimeter(CAL) Array of 1536 Csl(Tl) crystals in 8 layers. Measure the photon energy; image the shower.
- Segmented Anticoincidence Detector (ACD) 89 plastic scintillator tiles. Reject background of charged cosmic rays; segmentation removes self-veto effects at high energy.
- Electronics System Includes flexible, robust hardware trigger and software filters.

Systems work together to identify and measure the flux of cosmic gamma rays with energy 20 MeV - >300 GeV.

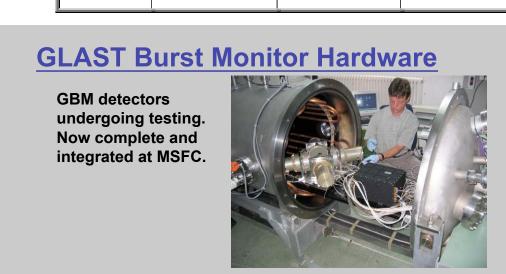

Large Area Telescope Hardware All 16 flight complete ar installed.

12% FWHM at 511 BD by analysis Rapid ground GRB | 5° accuracy (1º radius) (scattering influenced

GBM Performance Summary

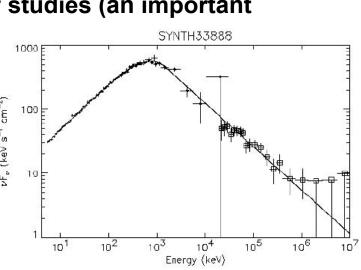

GLAST Burst Monitor (GBM)

GBM PI: Charles Meegan (MSFC) Co-PI: Giselher Lichti (MPE)

- provides spectra for bursts from 10 keV to 30 MeV, connecting frontier LAT high-energy measurements with more familiar energy domain. LAT and GBM together will measure GRB emission over >7 decades of energy;
- provides wide sky coverage (8 sr) -- enables autonomous repoint requests for exceptionally bright bursts that occur outside LAT FOV for high-energy afterglow studies (an important question from EGRET); •provides burst alerts to the ground.

Simulated GBM and LAT response to time-integrated flux from bright GRB 940217

Spectral model parameters from CGRO wide-band fit 1 NaI (14°) and 1 BGO (30°)

Mission Science Elements

- Science Working Group (SWG)
 - membership includes the Interdisciplinary Scientists, instrument Pls and instrument team representatives.
 - bi-monthly telecons and ~bi-annual sit-down meetings, along with community science symposia.
- Users Committee (GUC)
 - independent of the SWG. External review/feedback on science tools planning and progress. Currently meets twice/year.
 - broad membership to represent communities that are likely users of GLAST data.
- GLAST Science Support Center (GSSC)
 - located at Goddard. Supports guest observer program, provides training workshops, provides data and software to community, archives to HEASARC, joint software development with Instrument Teams, utilizing HEA standards.

Science Operations

- After the initial on-orbit checkout, verification, and calibrations, the first year of science operations will be an all-sky survey.
 - first year data used for detailed LAT characterization, refinement of the alignment, and key projects (source catalog, diffuse background models, etc.) needed by the community
- data on transients will be released, with caveats
- autonomous repoints for bright bursts and burst alerts enabled
- extraordinary ToO's supported
- workshops for guest observers on science tools and mission characteristics for proposal preparation
- Observing plan in subsequent years driven by guest observer proposal selections by peer review, in addition to sky survey. All data released through the science support center (GSSC).

Status and Summary

- The GLAST mission is well into the integration phase.
- LAT and GBM assembly complete in early CY06.
- Delivery of the LAT and GBM instruments for observatory integration, spring of 2006.
- Observatory integration spring 2006 through summer CY07.
- First GLAST Symposium planned for February 2007.
- Launch in September 2007... Science Operations begin within 60 days ... Join the fun!
